HDS 201s

Seamless 2x1 protecton switch

Features

100% seamless switching of critical digital video paths for broadcast applications. The HDS-201s will switch seamlessly between two mistimed input sources even on loss of primary feed.

Two modes of switching are provided; automatic and non-resetting. When set to automatic the HDS-201s will immediately switch back to the primary signal once that signal has been restored. In the non-resetting mode, the secondary input remains routed to the output, even after the primary input has recovered.

Mis-timed signals of up to a complete HD frame can be re-aligned, but no unnecessary delay is introduced by the card.

The unit has 2 Serial Digital (HD/SD-SDI) inputs, and 3 re-clocked SDI outputs. The signal is protected by a passive, fail-safe bypass relay that ensures there is an output even in the event of a total power failure.

The HDS 201s comes with integrated web interface, GPI and SNMP controls
